

Serotonin Antibody – Mouse Monoclonal

Ref: IS040

Anti-Serotonin antibody IS040 is a mouse monoclonal Ab specifically selected by competitive ELISA for its affinity and specificity features. Using with the [STAINperfect immunostaining kit A](#), our antibody directly labels 5-HT in whole mounts, cell cultures and tissue sections.

Clonality	Monoclonal antibody
Host	Mouse
Applications	IHC / IF
Reactivity	Reacts with all species
Tested samples	Whole mounts, cell culture, tissue sections
Staining procedure	STAINperfect immunostaining kit A
Format	50µL
References	Cited in 2 papers

INFORMATIONS

Product overview

Product name	Serotonin antibody – mouse mAb
Synonyms	Anti-5-HT antibody Anti-5-hydroxytryptamine antibody
Immunogen	Conjugated 5-HT
Specificity	When tested in competitive ELISA, the anti-conjugated Serotonin antibody did not show any significant cross reactivity with 5-Hydroxytryptamine analogs, including Tryptamine and 5-Methoxytryptamine
Volume	50µL

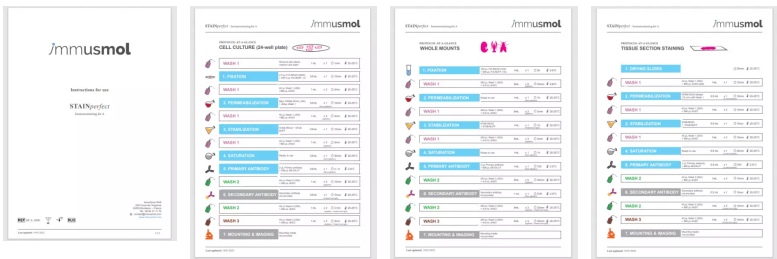

Storage

Form	Liquid
Purity	Purified anti-serum
Storage	Store at +4°C for short term (1-2 months). Aliquot and store at -20°C for long term. Avoid repeated freeze / thaw cycles
Material safety datasheet	Download MSDS

PROTOCOLS

IF - Cell cultures, Whole mounts, Tissue sections	Dilute antibody with the antibody diluent provided in the STAINperfect immunostaining kit A . Use at 1/250 -1/1000 dilution. Follow the STAINperfect protocol suited to your sample
Comments	Optimal working dilutions must be determined by the end-user
Restrictions	For research use only
Full protocol	Download STAINperfect protocol for Serotonin staining

Serotonin / Tyrosine Hydroxylase in mouse embryonic midbrain

Immunodetection of serotonin (red – IS040) and Tyrosine hydroxylase (green) in the mouse embryonic midbrain (E13.5) using mouse monoclonal anti-serotonin antibody (IS040) and rabbit polyclonal anti-TH antibody, following protocol for whole mount samples provided with STAINPerfect kit A (SP-A-1000).

Affinity & specificity of anti-Serotonin antibody

Competitive ELISA demonstrates that low amounts of Serotonin conjugate are required to abolish antigen-antibody reaction (high affinity), while rising concentrations of Serotonin competitors 5-Methoxy-Tryptamine or Tryptamine do not affect reaction (high specificity).

Serotonin neurons and fibers in embryonic mouse medulla

Using STAINperfect immunostaining kit A, the anti-Serotonin mouse monoclonal antibody (Ref: IS040) demonstrates the presence of serotonin in embryonic mouse medulla (E13.5). The staining was performed according to the protocol optimized for whole-mount samples and was revealed using fluorescent conjugated secondary antibody.

Serotonin - 5-hydroxytryptamine (5-HT)

Serotonin is a monoamine neurotransmitter derived from tryptophan metabolism. Either produced by gut cells or synthesized by serotonergic neurons in the brain, Serotonin is known to be involved in the regulation of appetite, mood, sleep, memory, aging, and to modulate both innate and adaptive immune responses.
