## Saliva Progesterone ELISA kit

This Saliva Progesterone ELISA kit enables the measurement of progesterone in saliva within 75 minutes, whose levels increase significantly after ovulation. Highly relevant for fertility studies, this immunoassay can also be used to monitor early pregnancy, evaluate progesterone-based hormone therapies, and investigate endocrine disorders as well as stress-hormone interactions. Based on a 96-well plate format and offering a non-invasive sampling method, this rapid assay allows for longitudinal progesterone monitoring.
